Abstract

In this paper, we discuss about the connection between graph theory and cryptography. We use the spanning tree concept of graph theory to encryption the message.

Key words: Public key, cryptography, graphs, encryption, network security.

AMS classification: 39A10, 39A11, 39A13, 39A70, 49M.

1. Introduction

Definition 1.1 Weighted graph is a graph in which each branch is given a numerical weight. A weighted graph is therefore a special type of labeled graph in which the labels are numbers.

Definition 1.2 A cycle graph of order n is a connected graph whose edges form a cycle of length n .

Definition 1.3 A spanning tree T of a graph G is a sub graph containing all the vertices of G . It is a minimal set of edges that connects all the vertices of G without creating any cycles or loops. Out of all the spanning trees of G , the minimum spanning tree is one with least weight.

Cryptography is the art of protect information by transforming it to unreadable format called Cipher text. The process of converting plain text to cipher text called encryption, and the process of converting cipher text on its original plain text called decryption. The remainder of this paper is a discussion of intractable problem from graph theory keeping cryptography as the base.

Firstly we represent the given text as node of the graph. Every node represent a character of the data. Now every adjacent character in the given text will be represented by adjacent vertices in the graph.

2. Proposed Application

Example 2.1 We will encrypt the text or data, say **HATE** , which we will be sending to the receiver on the other end.

Now we change this text into graph by converting each letter to vertices of graph.

Figure 1: Convert the letter to vertex(node)

To form a Cycle Graph , we link each two characters.

Further we label each edge by using the encoding table, which is followed by most researchers.

Table 1 : Encoding Table

A	B	C	D	-	-	-	-	W	X	Y	Z
1	2	3	4	-	-	-	-	23	24	25	26

The label on each edge represents the distance between the connected two vertices from the encoding table. So the edge connecting vertex *C* with vertex *O* has a label which is distance between the two characters in the encoding table.

Distance = code (*A*)–code (*H*) = 1 – 8 = –7.

Similarly we can deduce the distances of other edges. Then we label the graph containing all the plain text letters and we get weighted graph which is given below.

After that, we keep adding edges to form a complete graph and each new added edge has a sequential weight starting from the maximum weight in the encoding

Figure 2: cycle Graph

Figure 3: Weighted Graph

table which is 26. Therefore we can add 27,28 and so on.
Then add a special character before the first character to point to the first character, say A is special character , then we get

Figure 4: Complete plain Graph

Figure 5: Complete plain Graph with special character

Now represent the above graph in the form of a matrix.

$$A_1 = \begin{bmatrix} 0 & 7 & 0 & 0 & 0 \\ 7 & 0 & -7 & 27 & 3 \\ 0 & -7 & 0 & 19 & 28 \\ 0 & 27 & 19 & 0 & -15 \\ 0 & 3 & 28 & -15 & 0 \end{bmatrix}$$

We now construct a minimal spanning tree of the above graph.

Figure 6: Minimal spanning tree

$$A_2 = \begin{bmatrix} 0 & 7 & 0 & 0 & 0 \\ 7 & 0 & -7 & 0 & 0 \\ 0 & -7 & 0 & 19 & 0 \\ 0 & 0 & 19 & 0 & -15 \\ 0 & 0 & 0 & -15 & 0 \end{bmatrix}$$

Encryption Process :

Now we store the character order in the diagonal instead of zeroes as follows:

Table 2 :

A	H	A	T	E
0	1	2	3	4

Then the modified A_2 is

$$\begin{bmatrix} 0 & 7 & 0 & 0 & 0 \\ 7 & 1 & -7 & 0 & 0 \\ 0 & -7 & 2 & 19 & 0 \\ 0 & 0 & 19 & 3 & -15 \\ 0 & 0 & 0 & -15 & 4 \end{bmatrix}.$$

we multiply matrix A_1 by A_2 to form A_3 .

$$A_3 = A_1 A_2 = \begin{bmatrix} 49 & 7 & -49 & 0 & 0 \\ 0 & 98 & 499 & 36 & -393 \\ -49 & -7 & 410 & -363 & -173 \\ 189 & -106 & -151 & 225 & 60 \\ 21 & -193 & -250 & -45 & 225 \end{bmatrix}$$

Then use a Public Key K to encrypt C

Let
$$K = \begin{bmatrix} 1 & 1 & 1 & 1 & 1 \\ 0 & 1 & 1 & 1 & 1 \\ 0 & 0 & 1 & 1 & 1 \\ 0 & 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

so cipher text $C = KA_3$

$$C = \begin{bmatrix} 1 & 1 & 1 & 1 & 1 \\ 0 & 1 & 1 & 1 & 1 \\ 0 & 0 & 1 & 1 & 1 \\ 0 & 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 49 & 7 & -49 & 0 & 0 \\ 0 & 98 & 499 & 36 & -393 \\ -49 & -7 & 410 & -363 & -173 \\ 189 & -106 & -151 & 225 & 60 \\ 21 & -193 & -250 & -45 & 225 \end{bmatrix}$$

$$C = \begin{bmatrix} 210 & -201 & 459 & -147 & -401 \\ 161 & -208 & -508 & -147 & 401 \\ 161 & -306 & 9 & -183 & -8 \\ 210 & -299 & -401 & 180 & 165 \\ 21 & -193 & -250 & -45 & 225 \end{bmatrix}$$

We now send the encrypted data C to the receiver.

210 -201 459 -147 401 161 -208 -508 -147 401 161 -306 9 -183 -8 210 -299 -401 180
 165 21 -193 -250 -45 225

Decryption Process :

On the receiver side, C is got from multiplying the cipher text received with the inverse of shared Key Then calculate B by multiplying C by K^{-1}

$$A_3 = \begin{bmatrix} 210 & -201 & 459 & -147 & -401 \\ 161 & -208 & -508 & -147 & 401 \\ 161 & -306 & 9 & -183 & -8 \\ 210 & -299 & -401 & 180 & 165 \\ 21 & -193 & -250 & -45 & 225 \end{bmatrix} \begin{bmatrix} 1 & -1 & 0 & 0 & 0 \\ 0 & 1 & -1 & 0 & 0 \\ 0 & 0 & 1 & -1 & 0 \\ 0 & 0 & 0 & 1 & -1 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\text{Therefore , } A_2 = A_3 A_1^{-1} = \begin{bmatrix} 0 & 7 & 0 & 0 & 0 \\ 7 & 0 & -7 & 0 & 0 \\ 0 & -7 & 0 & 19 & 0 \\ 0 & 0 & 19 & 0 & -15 \\ 0 & 0 & 0 & -15 & 0 \end{bmatrix}$$

Then A_2 represent the below graph, regardless of te diagonal, we use it to retrieve the original text.

Figure 7: Decrypted Graph

We suppose that the vertex 0 is A, and by using encoding table

Vertex 1 = code (A) + 7 = 8, which is character H

Vertex 2 = code (H) - 7 = 1, which is character A

Vertex 3 = code (A) + 19 = 20, which is character T
Vertex 4 = code (T) + -15 = 5, which is character E
Which gives us the original text H A T E
